4. ADDITIONAL INFORMATION ON MINERALOGY, RADIOACTIVITY, GEOLOGY, MINING, ETC.
Previously reported radiometric anomalies near the west end of the 2400 and 2770 levels were checked by Scintillometer and found to be very weak.

Best occurrence was found within 90 foot zone of abnormal radioactivity on the 3070 level. Along the entire zone the Scintillometer registered from 60-120 counts per second. From survey station 1155 - 35 feet to 1155 - 40 feet, a 1/4" silicified jasperoid veinlet gave a reading of 250 counts per second.

Some of the radioactive material occurs as filling in minor bedding slips and small fractures, but the siliceous jasperoid veins are the most promising types of occurrence, and these veins appear confined to the footwall.

4. ADDITIONAL INFORMATION ON MINERALOGY, RADIOACTIVITY, GEOLOGY, MINING, ETC.

This investigation of the Page mine consisted of a radiometric survey of all underground workings which have been developed subsequent to February, 1952. The portions of the mine included in this examination are as follows:

- 1200 Level
- 2100 Level - Ω Vein
- Omega Vein
- 2465 Level - Intermediate East
- 2500 Level - East
- 3370 Level

No abnormal radioactive anomalies were detected during the course of this examination.
