INTRODUCTION

Summarizes geology and modeling of the control over major gold deposits, including the relationship between geology and gold mineralization. The digital map is intended to be a useful tool for geologists and mineral explorationists. The geological data and information presented in the map are based on various sources, including laboratory analyses, field observations, and existing geological maps. The map is designed to provide a clear and comprehensive overview of the geology of the area.

DESCRIPTION OF MAP UNITS

These units represent different rock types and have been assigned various colors and symbols for easy identification. Each unit is described in detail in the legend, which includes information on rock type, age, and other relevant geological characteristics.

CORRELATION OF MAP UNITS

The map includes a correlation diagram that shows the relationship between different geological units. This diagram is useful for understanding the spatial distribution and connectivity of the various rock types.

ACKNOWLEDGEMENTS

The authors acknowledge the support of the U.S. Geological Survey, the Idaho Geological Survey, and the University of Idaho for funding and assistance in the production of this map. We also thank the reviewers for their valuable comments and suggestions.
