INTRODUCTION

The geologic map of the Shoshone SE Quadrangle, Jerome and Lincoln Counties, Idaho, was prepared by Scott Matthews, John W. Shemais, John D. Kaufman, and Karl L. Ciliberti in 2006. The map provides a detailed view of the geologic layers and formations within the area, allowing for a better understanding of the geological history and structure of the region.

DESCRIPTION OF MAP UNITS

There are various map units that make up the geologic layers of the Shoshone SE Quadrangle. Each unit is represented by different colors and symbols on the map, indicating the type of geological formation, its age, and other relevant details.

SYMBOLS

- Contours: These represent the elevation changes across the map area. The intervals are specified in the map's legend.
- Road: These lines indicate the location of major roads and highways within the map area.
- Town: These markers indicate the location of towns and cities in the region.
- County: These labels identify the counties that are covered by the map.
