INTRODUCTION

The surface geologic map of the Moscow East quadrangle and part of the Moscow West quadrangle, Latah County, Idaho, was prepared by Karl L. Othberg and Roy M. Breckenridge as part of the Idaho Geological Survey's effort to map surface geology in the state. The map is intended for those interested in the area's natural resources, urban and rural growth, and private and public land development. The information relates to current geologic knowledge and is intended for use in assessing the extent and limits of ground water in the area. Further intensive analyses at specific locations should be made by consultants, local, state, and federal agencies, and the appropriate land management agencies. The map has been made available in the State Map Program.
