PRODUCTION STATISTICS FOR THE COEUR D'ALENE MINING DISTRICT,  
SHOSHONE COUNTY, IDAHO--1884-1980

Compiled by

Victoria E. Mitchell<sup>1</sup> and Earl H. Bennett<sup>1</sup>

INTRODUCTION

This report is a compilation of production figures from 1884 to 1980 for individual mines in the Coeur d'Alene mining district located in north Idaho. Total production for the district is summarized in Table 1. Most of the information was obtained from the U. S. Bureau of Mines' (USBM) files located at the U. S. Bureau of Mines' Western Field Operations Center in Spokane, Washington. Other important sources include Crosby (1959), Asarco (1960), a series of consulting reports by Shenon and Full (1948-1955), tonnage figures from the Shoshone County assessor's office, and data from individual companies. In most cases, figures from the different sources were in agreement. The U. S. Bureau of Mines' figures, being the most complete, were utilized as the major data base. For some mines, both USBM and company figures are presented for comparison.

The Idaho Bureau of Mines and Geology maintains a file on yearly production figures for each mine in the Coeur d'Alene district. These files are available for inspection at IBMG's office at the University of Idaho, Moscow, Idaho.

Our reason for compiling these data is to provide an accurate accounting of the distribution of metals throughout the district. We believe that this information will be useful to geologists and others interested in unraveling the origin of these deposits and in exploring for new ones.

---

<sup>1</sup> Idaho Bureau of Mines and Geology, Moscow, Idaho 83843.

The mines are grouped by a stratigraphic classification, rather than in the more familiar mineral belt concept used in other reports (Fryklund, 1964; Gott and Cathrall, 1980). Our purpose in using this classification is to show that definite differences exist in the metal production from mines localized in three different stratigraphic horizons, namely the Middle Prichard, the Prichard-Burke transition zone, and the Revett-St. Regis transition zone. The percentage of the total production in the district by stratigraphic group and selected districts is summarized in Table 2.

The production figures in Table 2 are misleading. The Revett-St. Regis deposits account for 76 percent of the total district tonnage; however, it is possible that the Bunker Hill mine and the Star mine, although in the Revett-St. Regis horizon, have derived a major part of their ore from the Prichard-Burke horizon, in effect making these two mines double orebodies (Bennett, in preparation). Juras (1979) described three vein types in the Bunker Hill mine: the Bluebird veins, the Link veins, and a combination of the two called hybrid veins. For this reason, we show the percentage of the total district production accounted for by the Wardner mines (includes Bunker Hill), and we also show beneath this figure, in parentheses, the percentage contributed by the Wardner mines minus the ore in the Bluebird veins and one third of the metal content from hybrid veins. The production figures that are calculated for the three vein types are shown in Table 3, and are derived from figures furnished by the Bunker Hill Company. Likewise, we show production from the remainder of the Revett-St. Regis deposits with the Star mine production and without the Star mine production (in parentheses). In the Summary of Stratigraphic Groups section, we show the percentage of the total district production attributed to the Prichard-Burke deposits by themselves and with the Bluebird veins, hybrid veins, and Star mine production added (in parentheses). Table 4 shows percentages of total production for the major mines in the district that produced over 3 million tons of ore.

A series of maps follows the production tables. These maps show the distribution of selected metal tonnages, grades, and ratios. The maps show the data for the mines as they are located in the district

today, and as they were probably located before movement along the Osburn and Dobson Pass faults. The palinspastic reconstruction places the Dago Peak stocks over the Gem stocks along the Dobson Pass fault, and assumes approximately 25 kilometers (19 miles) of right lateral transport along the Osburn fault as described by Bennett and Venkatakrishnan (1982). Explanations accompany each map set.

#### ACKNOWLEDGMENTS

The U. S. Bureau of Mines' figures used in this report are a valuable data base, and without these figures we would have little information about many of the mines in the Coeur d'Alene district. We would like to thank the Sunshine Mining Company, Hecla Mining Company, Asarco, Bunker Hill Company, Callahan Mining Company, Coeur d'Alene Mines Corporation, Sidney Mining Company, and Harry F. Magnuson and Associates for authorizing the release of these data to us. Individuals who were instrumental in providing company information included Garth Crosby and Wallace Crandall, Hecla Mining Company; Stan Huff, Asarco; and James Duff and Mel Baillie, the Bunker Hill Company. Donald Springer provided data from his personal files and helped edit the manuscript.

\* Not included in total of tons produced

-- Data insufficient or unavailable

\*\* Correction: This number has been changed from that given in the original Technical Report. Copper production for the Constitution mine was corrected in March 1986.

Table 2. Percent of total production through 1980 in the Coeur d'Alene mining district by stratigraphic groups and districts.

Revett-St. Regis Deposits				
<u>District</u>	<u>Tonnage</u>	<u>Silver</u>	<u>Lead</u>	<u>Zinc</u>
Wardner (without Bluebird and 1/3 hybrid veins <sup>1</sup> )	33% (24%)	17% (14%)	40% (31%)	29% (13%)
Page Group	3%	2%	4%	7%
Silver Belt	13%	49%	1%	0.1%
Remainder of Revett-St. Regis (without Star mine <sup>2</sup> )	26% (21%)	16% (15%)	31% (27%)	44% (27%)
<b>TOTALS</b> (with Star, Bluebird, and hybrid veins)	75%	84%	76%	80%
<b>TOTALS</b> (without Star, Bluebird, and hybrid veins)	(61%)	(80%)	(58%)	(47%)

Middle Prichard Deposits				
<u>District</u>	<u>Tonnage</u>	<u>Silver</u>	<u>Lead</u>	<u>Zinc</u>
Pine Creek	2%	0.5%	1%	5%
Upper Ninemile Creek and Sunset Peak	3%	0.5%	1%	5%
<b>TOTALS</b>	5%	1%	2%	10%

Summary by Stratigraphic Groups				
<u>Stratigraphic Group<sup>3</sup></u>	<u>Tonnage</u>	<u>Silver</u>	<u>Lead</u>	<u>Zinc</u>
Middle Prichard (includes Evolution district)	5%	1%	2%	10%
Revett-St. Regis (without Star, Bluebird, and hybrid veins)	75% (61%)	84% (80%)	76% (75%)	80% (47%)
Prichard-Burke (with Star, Bluebird, and 1/3 hybrid veins <sup>4</sup> )	19% (33%)	14% (18%)	25% (25%)	7% (41%)
<b>TOTALS</b> (with Star, Bluebird, and hybrid veins)	99%	99%	103%	97%
<b>TOTALS</b> (without Star, Bluebird, and hybrid veins)	(99%)	(99%)	(102%)	(98%)

<sup>1</sup> Bluebird and hybrid veins are in the Bunker Hill mine (see Introduction).

<sup>2</sup> Star subtracted from Revett-St. Regis percentages.

<sup>3</sup> See Figure 1 for the location of the individual mines in each group.

<sup>4</sup> Star, Bluebird, and one-third of the hybrid veins in the Bunker Hill mine are added to the Prichard-Burke percentages.

Table 3. Estimated production from the vein systems in the Bunker Hill mine through 1980.\*

<u>Vein type</u>	<u>Tonnage</u>	<u>Silver (oz)</u>	<u>Lead (tons)</u>	<u>Zinc (tons)</u>	<u>Silver (oz/ton)</u>	<u>% Lead</u>	<u>% Zinc</u>
Link veins	18,629,883	117,574,783	1,982,426	474,304	6.3	10.6	2.5
Hybrid veins	9,361,101	42,754,125	928,266	263,584	4.6	9.9	2.8
Bluebird veins	8,993,246	14,245,625	294,024	535,513	1.6	3.0	6.0

<sup>1</sup> Includes all lease records as well as metal production from rerun tailings and smelter slag (tonnages for tailings and slag were not included under tons produced, as these were already counted when originally mined). Metal figures are actual metal recovered.

<sup>2</sup> Company figures based on assays (production grade) and not on recovered metal.

<sup>3</sup> Bunker Hill estimate of ore tonnage prior to 1904 is believed to be too high. We used shipping records provided by Asarco to calculate early production and added these figures to the USBM figures.

Table 11. Continued.

<sup>1</sup> Sunshine mine notes:

Production figures from 1904 to 1942 were from the Sunshine vein. The 1943 production figures included the Sunshine and Chester veins.

In 1943, the Silver Syndicate-Chester vein was divided into the Rambo area to the west (owned 60 percent by Sunshine Mining Company and 40 percent by Silver Syndicate, Inc.) and the Omega area to the east (owned 50 percent by Sunshine Mining Company and 50 percent by Polaris Mining Company).

The 1944 production figures included the Sunshine, Chester, and Syndicate veins. The Chester and Syndicate veins are in the Rambo, Omega, and Rotbart areas (see below).

	Rambo (Sunshine, Syndicate)	Omega (Sunshine, Polaris)	Rotbart (Sunshine, Silver Dollar)
Sunshine	Silver Syndicate Fault		Chester Vein
1943	141,955	None	21,405
1944	3,298	91,956 tons from the Rambo, Omega, and Rotbart areas	

The 1950 figures included production from areas controlled by Metropolitan, Syndicate, Polaris, and Silver Dollar.

The 1951 figures included production from areas controlled by Metropolitan, Syndicate, Polaris, Silver Dollar, and Big Creek Apex.

The 1952 figures included production from areas controlled by Metropolitan, Syndicate, Polaris, Silver Dollar, Big Creek Apex, the St. Germain-Purim mine, and the Rockford group.

The 1954 U. S. Bureau of Mines figures for the Sunshine mine include production from all areas.

Production for the following years are missing from totals: lead, 1971-1973 and 1978-1980; zinc, 1971-1974 and 1976-1980; gold, 1971-1973 and 1978-1980; and copper, 1978-1980.

<sup>2</sup> Polaris Mining Company mined the Polaris mine until 1943. All production from Polaris ground from 1944 on is included in the Sunshine mine figures.

<sup>3</sup> From 1948 to 1969, Polaris (Hecla) operated the Silver Summit mine.

<sup>1</sup> The Gold Hunter mine is believed to have had considerable production prior to 1901, but there are no records available. This mine is in the Wallace Formation.

<sup>2</sup> The figures for the Dayrock mine include tonnages for 1924 to 1928, but not metal production for this period.

<sup>3</sup> The Butte and Coeur d'Alene mine is in the Wallace Formation.

<sup>1</sup> Figures prior to 1901 are from Ransome and Calkins, 1908, U. S. Geological Survey Professional Paper 62. There is an error in their production figures for the Tiger-Poorman mine. We have recalculated the figures, and instead of 286,424 ounces of silver (through 1905) we get 2,029,485 ounces, assuming 2.5 ounces of silver per ton.

<sup>2</sup> Gold and copper figures for the Golconda mine are from the U. S. Bureau of Mines for the years 1928 and 1929. The rest of the Golconda figures are from Shenon, Full, and Gerwels, 1952 (consulting report for Day Mines, Inc.).

<sup>3</sup> Production for the Sisters mine was provided by Donald Springer (personal communication, 1983). The mine is totally in the Prichard Formation and is of interest for the high silver value of the ore. Production is not added to the Prichard-Burke total as the small deposit is in the Prichard Formation.

USBM Data from the U. S. Bureau of Mines' Western Field Operations Center, Spokane, Washington

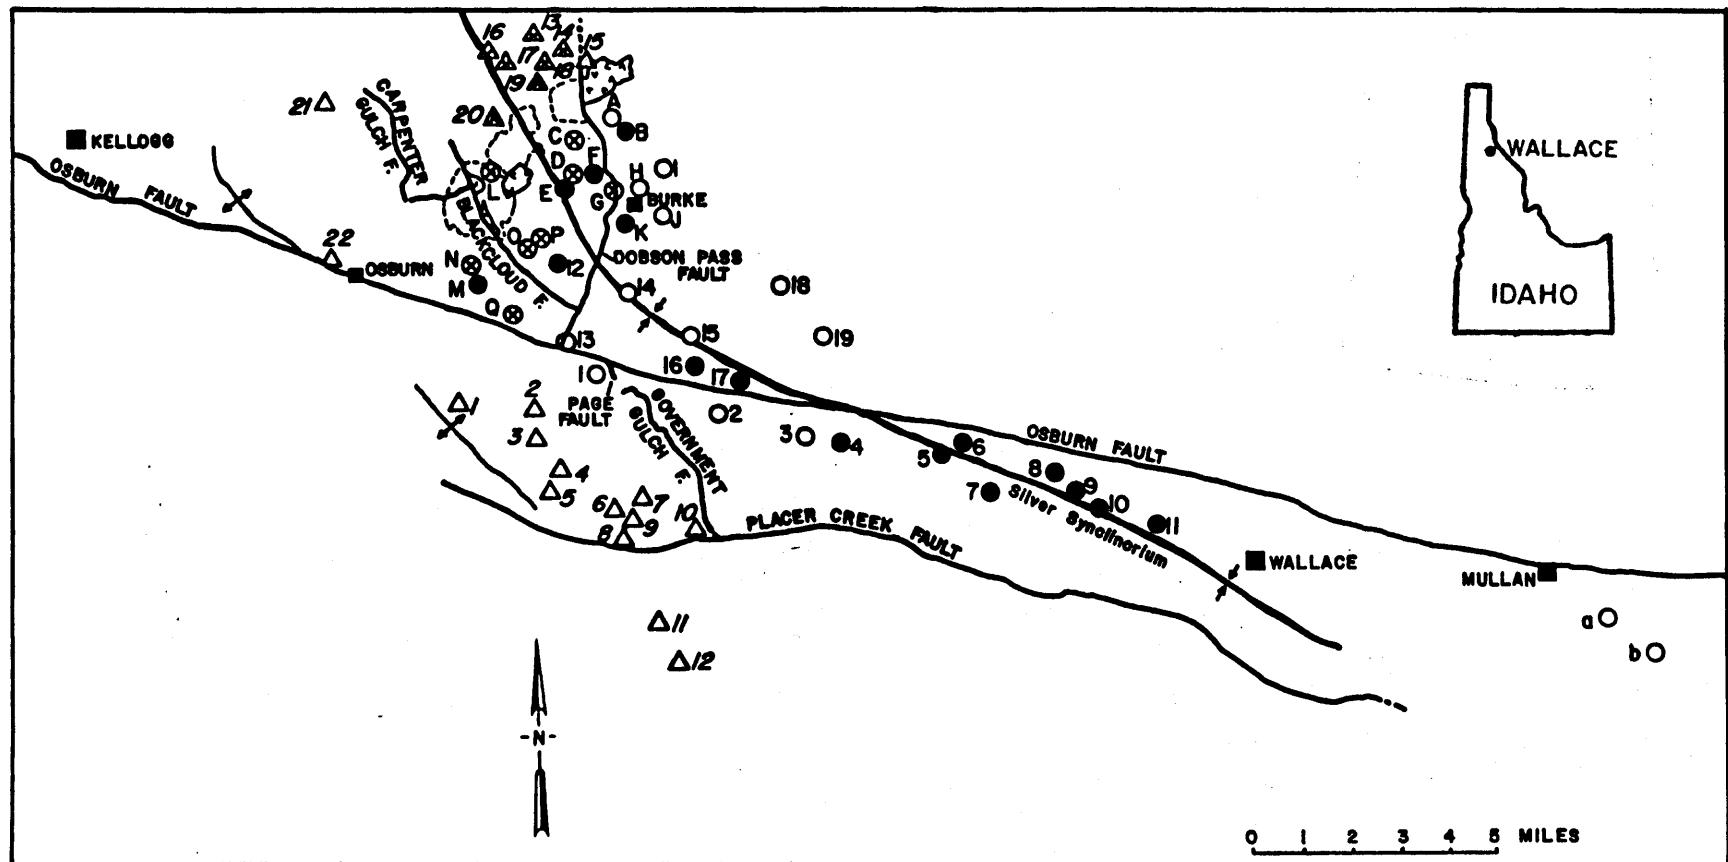

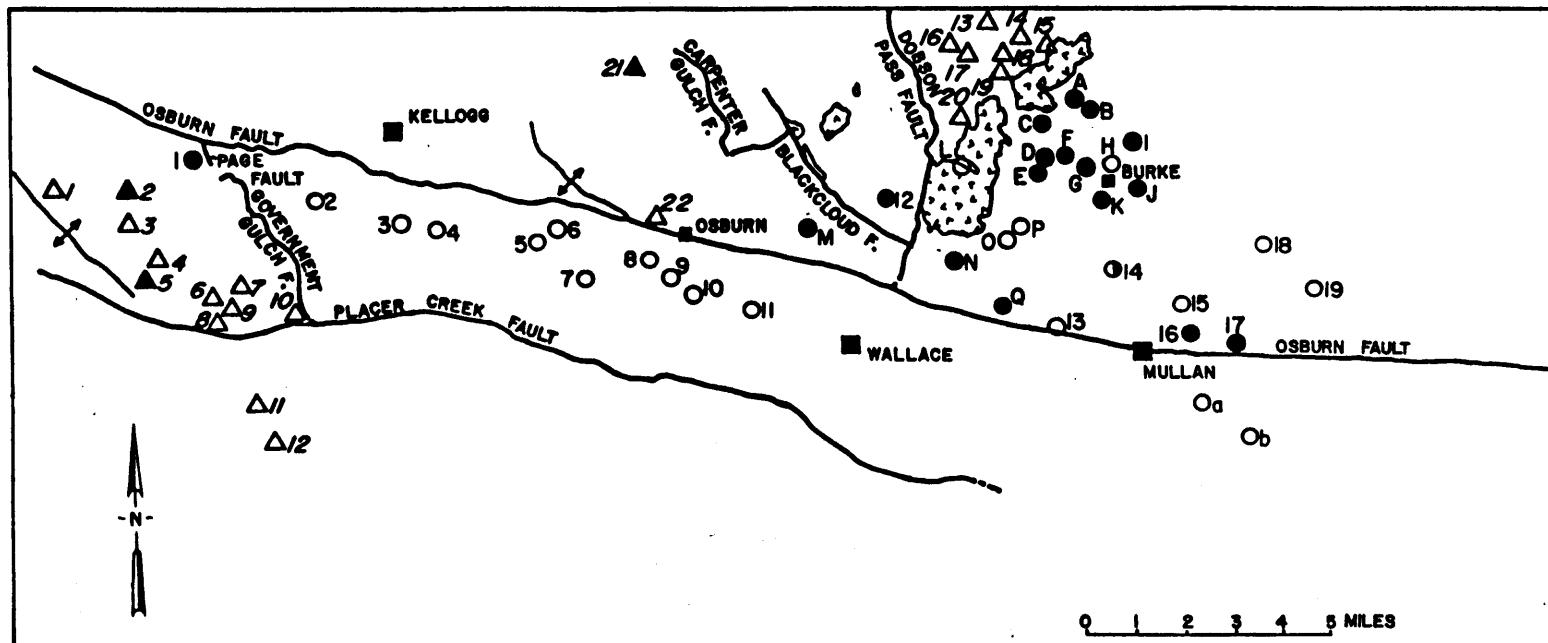

Figure 1. Location of mines in the Coeur d'Alene district grouped by stratigraphic position, highlighting the mines with 5 oz per ton silver or greater. Upper figure shows present locations and lower figure shows locations after reversing the movement along the Osburn and Dobson Pass faults (Bennett and Venkatakrishnan, 1982). Mines with 5 oz per ton silver or greater are shown as black dots. Circles and triangles with an X ( $\circledcirc$ ,  $\Delta$ ) represent mines located below the Dobson Pass fault as reconstructed in the lower figure. Deposits in the Middle Prichard are noted by italic numerals and a triangle symbol ( $\Delta$ ). The Gemstocks are shown by a barbed pattern.

#### Stratabound Disseminated Copper-Silver Deposits

18. National
19. Snowstorm

#### ATLAS BLOCK

- a. Atlas (Carbonate Hill)
- b. Reindeer Queen

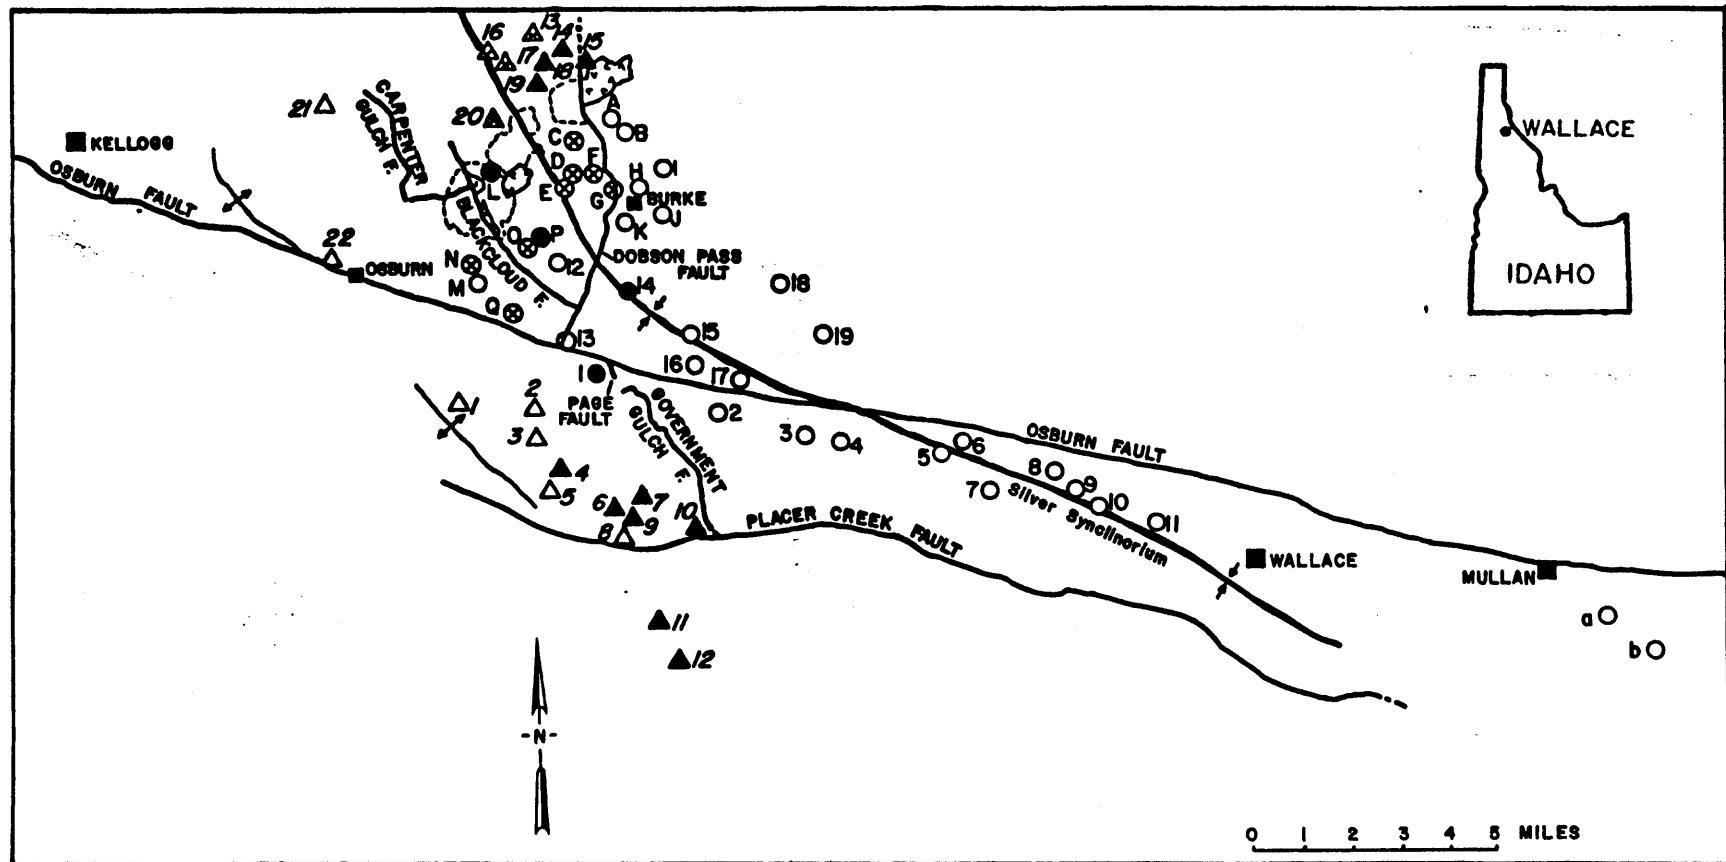

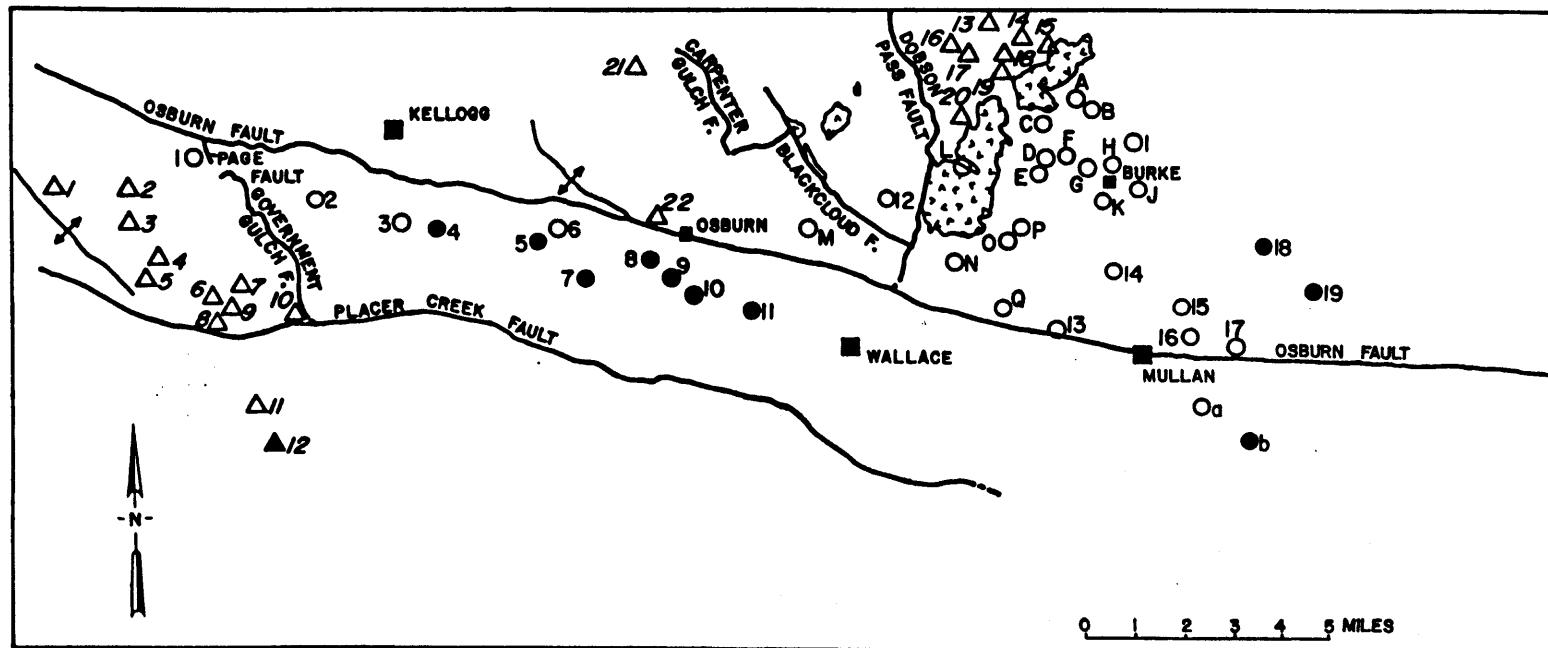

Figure 3. Location of mines in the Coeur d'Alene district grouped by stratigraphic position, highlighting the mines with 4 percent zinc or greater. Upper figure shows present locations and lower figure shows locations after reversing the movement along the Osburn and Dobson Pass faults (Bennett and Venkatakrishnan, 1982). Mines with 4 percent zinc or greater are shown as black dots. Circles and triangles with an X ( $\odot$ ,  $\Delta$ ) represent mines located below the Dobson Pass fault as reconstructed in the lower figure. Deposits in the Middle Prichard are noted by italic numerals and a triangle symbol ( $\gamma\Delta$ ). The Gemstocks are shown by a barbed pattern.

#### MIDDLE PRICHARD DEPOSITS

##### Pine Creek Area

1. Hypotheek
2. Bobby Anderson
3. Amy Matchless
4. Sunset (Liberal King)
5. Lookout Mountain
6. Nabob
7. Sidney
8. Hilarity
9. Little Pittsburg

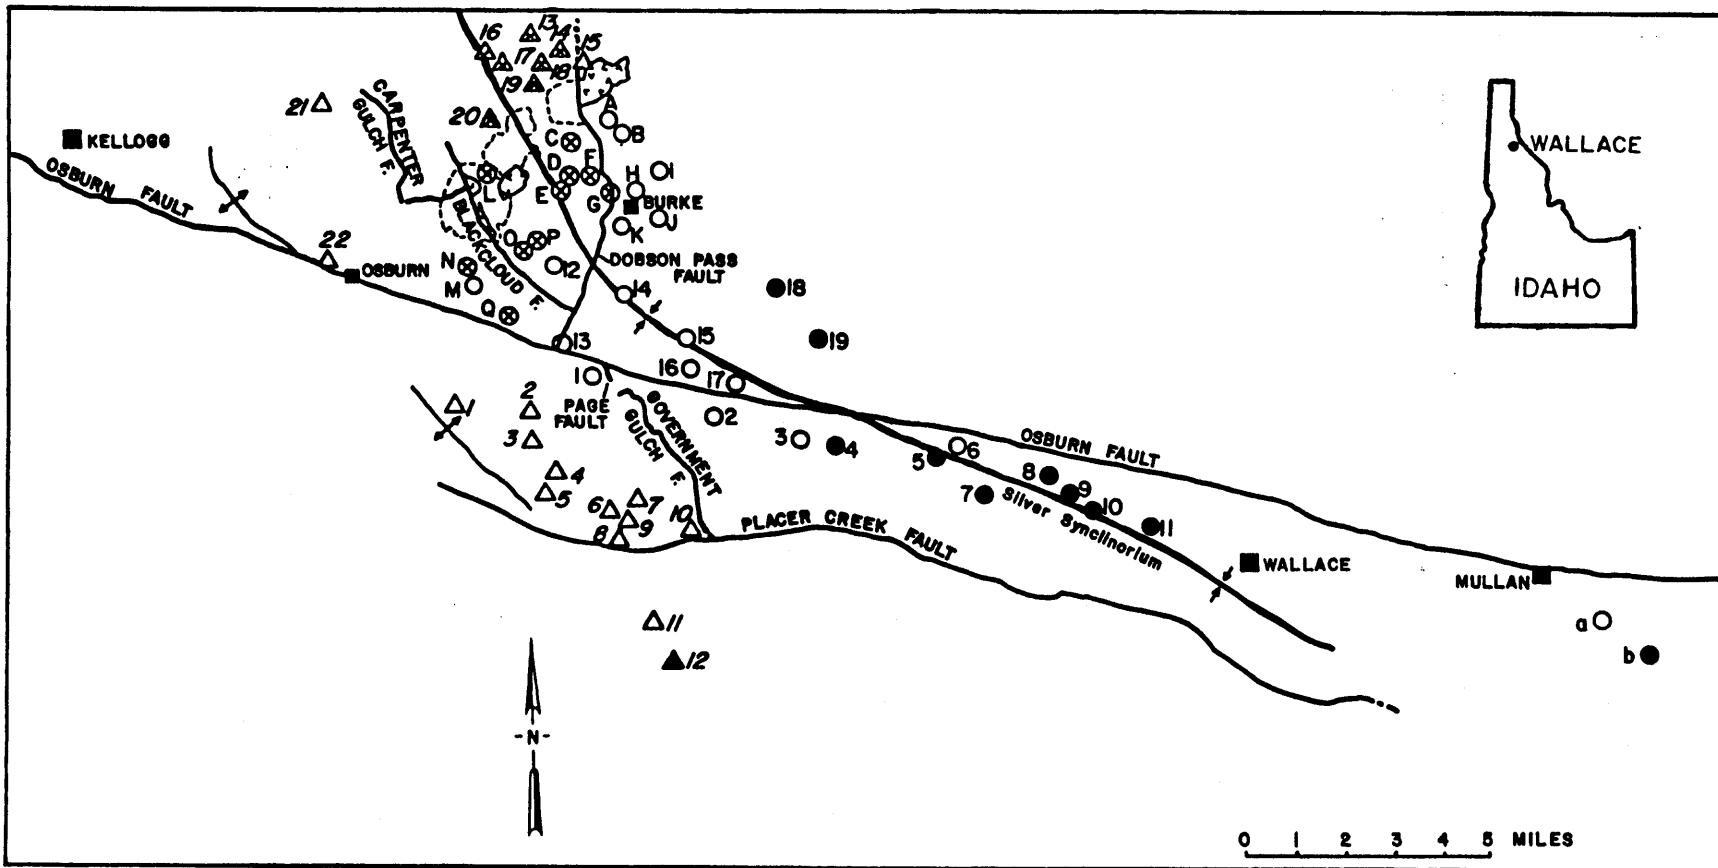

Figure 4. Location of mines in the Coeur d'Alene district grouped by stratigraphic position, highlighting the mines with 0.4 percent copper or greater. Upper figure shows present locations and lower figure shows locations after reversing the movement along the Osburn and Dobson Pass faults (Bennett and Venkatakrishnan, 1982). Mines with 0.4 percent copper or greater are shown as black dots. Circles and triangles with an X ( $\otimes$ ,  $\Delta$ ) represent mines located below the Dobson Pass fault as reconstructed in the lower figure. Deposits in the Middle Prichard are noted by italic numerals and a triangle symbol ( $\Delta$ ). The Gemstocks are shown by a barbed pattern.
